Search Notes

Examiner Davis,

Here are the results for your recent search request.

Please feel free to contact me if you have any questions about these results.

Thank you for using STIC services. We appreciate the opportunity to serve you.

Sincerely,

Mary Jane Ruhl Technical Information Specialist STIC Remsen 1-A-62 Ext. 22524

November 2005

Published_Applications Nucleic Acid and Published_Applications Amino Acid database searches now generate two sets of results each. The Published_Applications databases have been split into two parts to reduce the amount of time required for their daily updates. This results in more machine time being available for processing searches.

Newly published applications will appear in the Published_Applications_New databases: older published applications make up the Published_Applications_Main databases.

Searches run against Nucleic Acid Published_Applications produce two sets of results, with the extensions .rnpbm (Published_Applications_NA_New).

Searches run against Amino Acid Published_Applications produce two sets of results, with the extensions .rapbm (Published_Applications_AA_New).

.rapbm (Published_Applications_AA_New).

THE TOP BONK USC.

Protein Sequence Searches - February 2005

All of the sequence databases on ABSS have recently been updated.

- Please note that the curators of the UniProt database have purged some temporary accession numbers from the most recent version of UniProt. These sequences have been assigned new permanent accession numbers. The new UniProt record may not contain the previous temporary accession number.
- If you encounter an accession number from an older search run against UniProt (results file extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein Archive database (UniPARC) at:

http://www.pir.uniprot.org/database/archive.shtml

If you have any questions regarding this information or your results, please contact any STIC searcher.

When submitting sequence search results for scanning into IFW, please include a copy of this attachment to assist any future Examiners or members of the public who may encounter UniProt temporary accession This Page Blank Juspto

Chan, Christina

Subject:

Rush search request for 09/743825

Please search for interference only:

1) SEQ ID NO:1.

2) Nucleotides 77-1753 of SEQ ID NO:1.

3) SEQ ID NO: 7, 8 and 10, with size limitation for the data in the database to the size of the corresponding sequences.

THANK YOU

MINH TAM DAVIS

cancer.

Claim 5; Page 18; 51pp; English.

Novel gene which is dysregulated in prostate cancer useful for diagnosing

The present sequence is the human PB39 3' specific RACE primer, from EST clone AAR00504. It is used to determine the complete nucleotide sequence of PB39 cDNA, isolated from human pancreas cDNA library using RACE. The PB39 gene that is dysregulated in prostate cancer has homology to the EST AAR00504. PB39 gene is located on chromosome 11p11.1-11.2. Abnormally

```
ö
high concentrations of PB39 are found in prostate tissue derived from prostate cancer (PC) epithelium. PB39 sequence is useful for detection of precancerous or cancer cells in the prostate. PB39 is useful for early diagnosis of the progression of prostate cancer, especially in aggressive prostate carcinoma. It can also distinguish PC from other non-neoplastic prostate disease. The diagnostic method is selective and specific for various types of PC and also facilitates identifying prostate cancer of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema frames of the C. pneumoniae genome (see AAX345819 can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae mucleotides sequences can also be used as immunogenic compositions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

```
The invention relates to a compound targetted to a nucleic acid molecule encoding haematopoietic cell protein tyrosine kinase. The compound inhibits the expression of haematopoietic cell protein tyrosine kinase and it specifically hybridises with the nucleic acid molecule encoding the tyrosine kinase or with at least an 8-nucleobase portion of an active site on the nucleic acid molecule encoding the tyrosine kinase. The antisense compounds are useful for modulating the expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             haematopoletic cell protein tyrosine kinase and treating diseases or conditions associated with the expression of the tyrosine kinase, such as hyperpoliferative disorders (e.g. cancer), inflammation, diabetes or a viral infection. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in

The invention relates to an isolated polypeptide (I) critical for the survival of Haemophilus sp. comprising an amino acid sequence having at least 95% structural similarity with an amino acid sequence chosen from AEE31317, AEE313132, AEE31345, AEE31353, AEE31354 and AEE31317, AEE313130, AEE31345, AEE31345, AEE31354 and EAE31358. Also described: (I) an isolated polynucleotide (II) critical for the survival of Haemophilus sp. comprising a nucleotide sequence having at least 95% structural similarity with nucleotide sequence chosen for a coding sequence in AEE31062, AEE31130, AEE31140, AEE31155, AEE31156, and AEE31241, AEE31241, AEE31241, AEE31241, AEE31241, AEE31241, AEE31241, AEE31241, AEE31346, and a sequence comprising a nucleotide sequence chosen from AEE31062, AEE31130, AEE311310, AEE31331, AEE31331, AEE31331, AEE31332, AEE31333, 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated polypeptide critical for survival of Haemophilus species, useful for reducing virulence of H. influenzae to be used as vaccine
                                                                                                                                                                                               Gaps
distinguishing between functions of various members of a biological pathway. The present sequence is human haematopoietic cell tyrosine kinase antisense oligonucleotide
                                                                                                                                                                                                  ö

          H. influenzae with reduced virulence, which involves altering a coding sequence in an H. influenzae to comprise a mutation, the non-mutagenized ocoding sequence comprising a nucleocide sequence chosen from RES1062, AEE31130, AEE31140, AEE31141, AEE31241, AEE31241, AEE31243 and AEE31231, and determining if the H. influenzae comprising the mutation the mutation compared to an H. influenzae comprising the comprise the mutation, (5) an H. influenzae obtained by (M2) and (6) a vaccine composition comprising the H. influenzae. (1) is useful for reducing the decreasing the growth rate of a microorganism. The present sequence represents a PCR primer for a H. influenzae trxB coding sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a novel activated mutant protein tyrosine kinases and associated methods for diagnosing cancer and screening for anti-cancer agents. Protein kinases are signalling molecules involved in tumourigenesis. Mutational analysis of the human tyrosine kinase gene family identified somatic alteration sin 1 in 5 colorectal cancers, with the majority of mutations occurring in the NTRK3, FES, GUCY2F and MCCK/MLK4 genes. Most were identified in the kinase domain. The invention may be useful for the production of compounds with a cytostatic activity actimulators. The invention may be useful for developing methods for

Diagnosing hereditary hemochromatosis, involves providing sample comprising patient's nucleic acid, detecting presence or absence of A424G allele of polymorphism in nucleic acid that encodes transferrin receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              diagnosis and treatment of iron misregulation diseases including HFB bolypeptides and the polynucleotides encoding them. The iron misregulation diseases include both iron overload diseases and iron deficiency diseases. The invention is useful for diagnosing hereditary hemochromatosis and in gene therapy. The present sequence is human transferrin receptor (TFR) cDNA 424A allelle specific biotin-labeled oligonucleotide. This oligonucleotide is used in the screening for A424G polymorphism in the hereditary hemochromatosis patient chromosomes.
detecting mutations involved in cancer or screening for anti-cancer agents. The present sequence is that of a human-derived oligonucleotide which is related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                        diagnosis; pharmaceutical; iron overload; toxicity; intoxication; disorder of iron metabolism; hemochromatosis; cardiant; hepatotrophic; metabolic disorder; gene therapy; TFR; transferrin receptor; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of treating hemochromatosis in a patient by administering the hemochromatosis protein HFB (HLA-H) to the patient. The method is used for treating hemochromatosis. The invention provides a molecular basis for the relationship of HFB to iron metabolism

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 46; 72pp; English.

regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat configuration. The enzymatic nucleic acid molecule is adapted to treat configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methorizexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatese, diabetes, obseity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury septicion, graft molecules are also useful for treating inflammatory bowel disease or centerial nervous system (CNS) and mycocardial) glopesty, autoimmune disease, lupus, maltiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury septience or acid used to a necrosis factor kappa B sub-unit The invention describes an enzymatic nucleic acid molecule (I) which down

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG'2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung,

prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,

cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapises such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, gemcitabine or radiation therapy. The enzymatic and antisense nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of nucleic acid moderness encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAZ48482-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA
acid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or inflection. This sequence represents the substrate of a novel enzymatic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TMFR1), where the antisense compound inhibities expression of TMFR1. The antisense compound is useful for inhibiting the expression of TMFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TMFR1, e.g. a liver disease (such as hepatitis, or liver the expression of TMFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inhibiting radiation-induced apoptosis in a cell or tissue comprises administering to the cell or tissue an antisense oligonucleotide targeted to a nucleic acid molecule encoding tumor necrosis factor receptor 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a method of inhibiting radiation-induced apoptosis in a cell or tissue comprising administering to the cell or tissue an antisense oligonucleotide of 8-30 nucleotides in length targeted to a nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNPR1). The method and antisense oligonucleotides are useful for inhibiting radiation-induced apoptosis in a cell or tissue, and for treating diseases associated with the expression of TNPR1. This sequence

New nucleic acid, useful in imparting disease resistance to a plant or in preparing a composition for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to the isolation of Pseudomonas syringae pv. tomato DC3000 Avr/Hop proteins, and the polynucleotide sequences encoding them. Also disclosed are expression vectors, host cells, and transgenic plants comprising polynucleotide sequences of the invention. The polynucleotide and polypeptide sequences are useful in imparting disease resistance to a plant or in preparing a composition for treating cancer. The sequences may also be used to make a plant hypersusceptible to colonisation by nonpathogenic bacterial modify a metabolic pathway in a cell, cause enkaryotic cell death, and inhibit programmed cell death. The present sequence represents a PCR primer used in the examples of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to novel Pseudomonas Avr and Hop genes, a sequence that hybridizes with these sequences under stringency conditions comprising a hybridization medium that includes 0.9 x saline sodium citrate (SSC) buffer at a temperature of 42 deg C. The nucleic acid molecule is useful for preparing a composition for treating cancer. This sequence corresponds to a PCR to isolate and amplify one of the genes of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HMG-COA reductase; 3-hydroxy-3-methylglutaryl-Coenzyme A;

                                                                   The invention relates to novel compounds of 8-80 nucleobases in length targeted to, and which specifically hybridises with, a nucleic acid molecule encoding 3-hydroxy-3-methylglutaryl-Consyme A (HMG-CoA) reductase, and inhibits the expression of HMG-CoA reductase. The novel compounds have cardiant, antiarteriosclerotic, and antilipaemic activities. The compound can be used to treat disorders by antisense gene therapy. The compounds compositions and methods are useful for treating a disease or condition associated with HMG-CoA reductase, such as a cardiovascular disorder e.g. atherosclerosis, or a disease or condition involving cholesterol metabolism. They are also useful in research and diagnostics for modulating the expression of HMG-CoA reductase. This polynucleotide sequence represents an antisense oligonucleotide of the

CA The present sequence is the BST AAR00504-specific PCR primer, used for CC amplification of sequences contained within the BST AAR00504. It is C useful to probe the gene overexpressed in prostate cancer epithelium and CC to analyse the differential expression of the BST. The PB39 gene that is CC dysregulated in prostate cancer is isolated from human pancreas CDNA

                                                                                                                                                                                          ö
library and has homology to the EST AAR00504. PB39 gene is located on chromosome llpli.1-11.2. Abnormally high concentrations of PB39 are found in prostate tissue derived from prostate cancer (PC) epithelium. PB39 sequence is useful for detection of precancerous or cancer cells in the prostate. PB39 is useful for early diagnosis of the progression of prostate cancer, especially in aggressive prostate carcinoma. It can also distinguish PC from other non-neoplastic prostate disease. The diagnostic method is selective and specific for various types of PC and also facilitates identifying prostate cancer of differing aggressiveness and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a polynucleotide comprising an RNA sequence. The polynucleotides, vector, libraries, and method are useful in lowering the amount of RNA and/or protein production in cells used in drug development process. The present sequence represents a knock-down target sequence.
                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New knockdown sequences, useful in lowering the amount of RNA and/or protein production in cells used in drug development process.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel DNA molecule which comprises a DNA molecule made up of the following elements in a 5' to 3' direction: a first restriction endonuclease site; a T3 promoters site; at least of the state of the sequences; a poly A site having at least 21 consecutive A residues; a second restriction endonuclease site; and the same or different than the first restriction endonuclease site; or a T7 Promoter on the opposite strand as the T3 promoter. The invention may be useful in nucleic acid analysis, in particular to synthetic Tag genes useful as assay controls, in assay development, product development and validation and for quality control. The present sequence is that of a Tag oligonucleotide probe which may be used during the creation of the novel DNA molecule of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New DNA molecules made by annealing and extending overlapping 60mer oligonuclectides, useful in producing synthetic Tag genes useful as assay controls, in assay development, product development and for quality

                              Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (See AAZ01425). These ORFs encode polypeptides (See AAX36754-X37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, pendumitis, cervicitis, salpingttis, perihepatitis, bartholinitis, pneumopathy in breast feeding infants; and venereal lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Haplotype mapping; genetic marker; single nucleotide polymorphism; SNP; major histocompatibility complex; MHC; HLA; human leukocyte antigen; immune disorder; inflammation; inflammatory bowel disease;

The invention relates to a method of identifying the nucleotide for each of a set of single nucleotide polymorphisms (SNPs) in the major of a set of single nucleotide polymorphisms (SNPs) in the major comprising to comprising the HLA type for the individuals and identifying an SNP haplotype in the population that correlates with the HLA type, where the SNP haplotype in the population that correlates with the HLA type, where the SNP haplotype comprises the SNPs in the MHC region. The invention can she relates to a method of predicting the HLA type of an individual, a method of determining the presence or absence of an individual, a correlates with susceptibility to a disease or condition, and a method of determining the susceptibility of an individual to a disease or condition. The disease or condition is an immune disorder or inflammatory condition selected from inflammatory bowel disease, ulcerative colitis, crowls a disease, rheumatoid arthritis, diabetes, diabetes mellitus, myssthemia gravis, vitiligo, Graves disease, Hashimoto's disease, Crohn's disease, systemic selectosis, polymositis, dermatomyositis, opermicious anemia, primary biliary cirrhosis, idiopathic thrombocytopenia processors and proce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to rat and human purinergic receptor treat disorders of the nervous system, rading sequences can be used to treat disorders of the nervous system, particularly diseases with a component of chronic inflammation, such as Alzheimer's disease, diseases involving acute or chronic inflammation such as rheumatoid arthritis, amyloidosis, bacterial, viral and other microbial infections, disorders of the haematopoietic system and immune response such as autoimmune disorders, allergies and lymphoproliferative disorders, diseases involving apoptotic cell death, such as cardiac and cerebral ischaemia and microbial infections, particularly tuberculosis. The present sequence is a PCR primer used to isolate the rat P2X_7 coding sequence

and the preterror uncumpliance monitoring when the and compound for its and electable molecule, preferably a fluorescent dye (e.g. propidium iodide). The inventive method is useful for screening a compound for its ability to modulate the permeabilishing activity of a mammalian P2X7 receptor useful for treatment of arthritic and respiratory disorders and neurodegenerative disease. It is particularly useful in the treatment of Albaimer's disease, diseases involving acute or chronic inflammation including rheumatoid arthritis, amyloidosis, bacterial, viral and other microbial infections, e.g. tuberculosis, disorders of the haematopoietic system and immune response, including autoimmune disorders, allergies and lymphoproliferative disorders diseases involving apoptotic cell death, such as cardiac and cerebral ischaemia. The sequence presented is a
                                                                                                                                                                                                                                                                                                                                                                Screening of compound for its ability to modulate permeabilizing activity of mammalian receptor useful for treating e.g. arthritis, and alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention discloses a method for screening a compound for its ability receptor. The P2Z receptor is a cell surface receptor for ATP and has been implicated in the lysis of antigen presenting cells by cytotoxic T lymphocytes, in the mitogenic stimulation of human T lymphocytes, as well as in the formation of multinucleated giant cells. The preferred agonist is adenosine triphosphate (ATP) or 3,-0-(4-benzoyl)benzoyl ATP (BZATP) and the preferred method comprises monitoring the uptake into the cell of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, epidermal growth factor receptor; EGPR, EGP-R, target sequence; hammerhead ribozyme; hairpin ribozyme; inhibition; cell proliferation; cancer; genetic drift; detection; mutation; ss.

This invention relates to a novel DNA molecule which comprises a DNA molecule made up of the following elements in a 5' to 3' direction: a first restriction endonuclease site; a T3 promoters site; at least one Tag gene comprising at least 5 20mer Tag sequences; a Poly A site having at least 21 consecutive A residues; a second restriction endonuclease site which may be the same or different than the first restriction endonuclease site; or a T7 Promoter on the opposite strand as the T3 promoter. The invention may be useful in nucleic acid analysis, in particular to synthetic Tag genes useful as assay controls, in assay development product development and validation and for quality control. The present sequence is that of a Tag oligonucleotide probe which may be used during the creation of the novel DNA molecule of the invention.
                                                                                                                    New DNA molecules made by annealing and extending overlapping 60mer oligonuclectides, useful in producing synthetic Tag genes useful as assay controls, in assay development, product development and for quality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel polynucleotide useful for PCR amplification along with two fragment from another set of sequences, or for detecting single nucleotide polymorphism in human gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61.0%; Score 12.8; DB 12; Length 20; 87.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes enzymatic nucleic acid molecules (NAMS) which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-R) gene. AAV97221 to AAV98043 and AAV98979 to AAV99090 represent specifically claimed target sequence from human EGF-R. AAV98044 to AAV98866 and AAV98866 to V9978 represent hammenhead ribozymes and hairpin ribozymes respectively for human EGF-R. The NAMS are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMS can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         knzymatic nucleic acids - which cleave RNA derived from an epidermal
growth factor receptor, useful for inhibiting cell proliferation and for
treating cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         restriction endonuclease site; T3 promoter site; Tag gene; Poly A site; T7 Promoter; nucleic acid analysis; synthetic Tag gene; assay control; assay development; product development; product validation;

                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel short interfering nucleic acid (siNA) that downregulates expression of the BCL2 gene by RNA interference. A siNA of the invention has cytostatic, immunosuppressive, virucide, and anti-HIV activity. The siNA are useful for modulate use (inhibition) of expression or activity of BCL2 by RNA interference. siNA are used to expression of BCL2 genes, in cells, tissue explants or organisms, e.g. for treating cancer, autoimmune diseases and viral infections (including by HIV) but also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacognomics, studying gene function and gene mapping (e.g. of single nucleotide polymorphisms). The sequences shown in ADF49273-ADF50143
                                                                                                                                                                                                                                                                                                                                               88; 81NA; human; BCL2; short interfering nucleic acid; RNA interference; cytostatic; immunosuppressive; virucide; anti-HIV; cancer; autoimmune disease; viral infection; HIV.

The invention relates to a novel short interfering nucleic acid (siNA) that downregulates expression of the BCL2 gene by RNA interference. A sulf of the invention has cytostatic, immunosuppression, vircide, and anti-HIV activity. The siNA are useful for modulation (inhibition) of expression or activity of BCL2 by RNA interference. siNA are used to modulate expression of BCL2 genes, in cells, tissue explants or organisms, e.g. for treating cancer, autoimmune diseases and viral infections (including by HIV) but also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacognomics, studying gene function and gene mapping (e.g. of single-nuclecotide polymorphisms). The sequences shown in ADF49273-ADF50143
                                                                                                                                                                                                                                                                                                                                                                                                                                                88; 81NA; human; BCL2; short interfering nucleic acid; RNA interference; cytostatic; immunosuppressive; virucide; anti-HIV; cancer; autoimmune disease; viral infection; HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer or autoimmune disease, downregulates expression of the BCL2 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

```
The invention relates to a novel short interfering nucleic acid (siNA) that downregulates expression of the BCL2 gene by RNA interference. A siNa of the invention has cytostatic, immunosuppressive, virucide, and anti-HIV activity. The siNA are useful for modulation (inhibition) of expression or activity of BCL2 by RNA interference. siNA are used to expression or activity be BCL2 by RNA interference. siNA are used to organisms, e.g. for treating cancer, autoimmune diseases and viral infections (including by HIV) but also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (e.g. of single nucleotide polymorphisms). The sequences shown in ADF49273-ADF50143 represent siNA of the invention.
                                                                     ss; siNA; human; BCL2; short interfering nucleic acid; RNA interference; cytostatic; immunosuppressive; virucide; anti-HIV; cancer; autoimmune disease; viral infection; HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer or autoimmune disease, downregulates expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        double-stranded short interfering nucleic acid; siNA; antiarteriosclerotic; neuroprotective; nootropic; antiparkinsonian; anticonvulsant; pulmonary disease; restenosis; atherosclerosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel short interfering nucleic acid (siNA) that downregulates expression of the BCL2 gene by RNA interference. A siNA of the invention has cytostatic, immunosuppressive, virucide, and anti-HIV activity. The siNA her useful for modulation (inhibition) of expression or activity of BCL2 by RNA interference. SiNA are used to modulate expression of BCL2 genes, in cells, tissue explants or organisms, e.g. for treating cancer, autoimmune diseases and viral infections (including by HIV) but also for drug screening, diagnosis, pharmacogenomics, studying gene function and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (e.g. of single represent siNA of the invention.

```
The invention relates to a double-stranded short interfering nucleic acid (siNA) molecule that down-regulates expression of an endogenous mammalian target gene comparish one or more chemical modifications and each strand of the double-stranded siNA comprises about 21 nucleotides. The siNA of the invention demonstrates antiarteriosclerotic, neuroprotective, cot in cotropic, antiparkinsonian and anticonvulsant activities and may be useful for down-regulating the expression of an endogenous mammalian target gene and therefore in the treatment of any disease or condition target gene and therefore in the treatment of any disease or condition target gene and therefore in the treatment of any disease or condition tissue or organism. The disease or condition may include pulmonary disease such as restenois, atherosclerosis, Alzheimer's disease, Parkinson's disease, epilepsy, dementia, huntington's disease or amyotrophic lateral sclerosis. Furthermore, the siNA may be utilised for gene therapy applications. The current sequence is that of the siNA DNA-RNA bybrid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New double-stranded short interfering nucleic acid molecule, useful for dwn-regulating the expression of an endogenous mammalian target gene or for tracting diseases that respond to modulation of gene expression or activity.

library and has homology to the EST AAR00504. PB39 gene is located on chromosome lipli.1-11.2. Abnormally high concentrations of PB39 are found in prostate tissue derived from prostate cancer (PC) epithelium. PB39 sequence is useful for detection of precancerous or cancer cells in the prostate. PB39 is useful for early diagnosis of the progression of prostate cancer, especially in aggressive prostate carcinoma. It can also distinguish PC from other non-neoplastic prostate disease. The diagnostic method is selective and specific for various types of PC and also facilitates identifying prostate cancer of differing aggressiveness and

C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX34584-AAX35879) can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     in immunogenic compositions as vaccines. Vectors containing C. pneumoniae mucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence encoding Lawsonia intracellularis Htrh, Ponh, Hypc, Lyss, Ycfw, ABC1 or Omp100 protein. The invention also relates to a genetic construct comprising a polynucleotide molecule that can be used to alter a Lawsonia gene, comprising a polynucleotide molecule comprising a sequence that is otherwise the same as ancleotide sequence of a htrh, ponh, hypc, lyss, otherwise the same as ancleotide sequence of a htrh, ponh, hypc, lyss, otherwise the same as ancleotide sequence of a htrh, ponh, hypc, lyss, otherwise to comprising a sequence that naturally flanks in mutations capable of altering the above mentioned genes or a polynucleotide molecule comprising a sequence that naturally flanks in situ the ORF of the htrh, ponh, hypc, lyss, ycfw, abcl or omp100 gene or its homologue. The invention also relates to a fusion protein of a polypeptide comprising an epitope of Htrh, Ponh, Hypc, Lyss, Ycfw, ABC1 or derivative. The invention further relates to a substantially pure composite of the invention and compositions of the present invention are useful for the prevention and diagnosis of L. intracellularis infections in susceptible animals, such as pigs. The invention relates to a new isolated polynucleotide molecule which encodes Lawsonia intracellularis HtrA, PonA, HypC, LysS, YcfW, ABC1 or Omp100 protein. The methods and compositions of the present invention are useful for the prevention and diagnosis of L. intracellularis infections in susceptible animals, such as pigs. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antibacterial; vaccine; HtrA; PonA; HypC; LysS; YcfW; ABC1; Omp100; diagnostic agent; infection; pig; porcine proliferative enteropathy; PCR; primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New Lawsonia intracellularis polypeptides, useful as vaccines, as diagnostic agents, or in preventing infections in susceptible animals such as pigs, e.g. porcine proliferative enteropathy.
New isolated Lawsonia intracellularis polynucleotide and polypeptide, useful for the prevention and diagnosis of Lawsonia infections in susceptible animals, such as pigs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

This invention relates to a novel isolated polypeptide derived from Lawsonia intracellularis. The invention may be useful for the development of compounds with an antibacterial activity or a vaccine. Specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Lawsonia intracellularis proteins: HtrA, PonA, HypC, LysS, YcfW, ABC1, and Cmp100. The DNA and protein sequences of the invention are useful for preventing Lawsonia intracellularis infection of animals (e.g. pig). The present DNA sequence was used in the exemplification of the invention. NOTE: The present sequence is not shown in the specification but was obtained from the Japanese Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HtrA; PonA; HypC; LysS; YcfW; ABC1; Omp100; infection; primer; probe; ss.
                                                      claimed are L intracellularis proteins, such as HtrA, PonA, HypC, LysS, YcfW, ABC1 and Omp100 proteins. The invention may be useful for the development of vaccines, diagnostic agents, or in preventing L intracellularis infections in susceptible animals such as pigs, for example porcine proliferative enteropathy. The present sequence is that of a PCR primer which was used for amplification and/or sequencing of a region of L intracellularis DNA during the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated polynucleotide comprising Lawsonia intracellularis nucleotide sequence that encodes HtrA, PonA, HypC, LysS, YcfW, ABC1 or Ompl00 protein or its essential portion, useful as diagnostic agent.
                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises the amino acid and coding sequences of the

The invention relates to Lawsonia intracellularis Hypc protein and a nucleotide sequence that encodes L. intracellularis HtrA, PonA, Hypc, Lyss, YcfW, ABCI, orfl and Omp100 protein. The invention also relates to an immunogenic composition or vaccine comprising an immunogenic amount of the proteins of the invention in combination with a pharmaceutical carrier. The composition is useful for diagnosing or preventing infections caused by L. intracellularis porcine proliferative enteropathy (PPE) in susceptible animals such as pigs. The present sequence is a primer used for sequencing pRR392 Lawsonia intracellularis gene cluster B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention relates to an antisense oligonucleotide or its active derivative selected from AEC46374-AEC46395, targeting human interleukin-CC derivative selected from AEC46374-AEC46395, targeting human interleukin-CC derivative selected from AEC46374-AEC46395, targeting human interleukin-CC oligonucleotide (or its active derivative, by adding consecutive oligonucleotide chain), a pharmaceutical composition comprising to nucleosides and linker stepwise or by cutting the Oligonucleotide out of composition for treating cancer. The oligonucleotide is an antisense composition for treating cancer. The oligonucleotide is an antisense coligonucleotide inhibiting the synthesis of proteins involved in the formation of metastases. The oligonucleotide is an antisense coligonucleotide inhibiting the production of transforming growth factor (TGP)-beta 1, TGF-beta 2, TGF-beta 3, cell-cell adhesion molecules coligonucleotide inhibiting the production of transforming growth factor (TGP)-beta 1, TGF-beta 2, TGF-beta 3, cell-cell adhesion molecules colimbiated in the preparation of a pharmaceutical composition for inhibiting the production of a pharmaceutical composition for inhibiting the production of a pharmaceutical composition for inhibiting the preparation of a pharmaceutical composition for inhibiting the production of a pharmaceutical composition for inhibiting the cancer, bronchogenic carcinoma, carcinoma, colorectal carcinoma, carcinoma, colorectal carcinoma, carcinoma, lung carcinoma, medullary carcinoma, and and neck cancer, paptilary carcinoma, medullary carcinoma, paptilary adenocarcinoma, prostate cancer, small concer, paptilary carcinoma, negatical cancer, paptilary carcinoma, paptilary adenocarcinoma, prostate cancer, small cancer, squamous cell carcinoma, carcinoma, sectal cancer, squamous call carcinoma, carcinoma, sectal cancer, squamous call carcinoma, tertinoma, tertinoma, uterine cancer, squamous cancer, squamous call carcinoma, tertinoma, tertinoma, production cancer, squamous cancer, squamous call carcin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ewing's tumor, craniopharyngioma, ependymoma, medulloblastoma, memangioblastoma, medullablastoma, melanoma, mesorbastoma, neuroblastoma, neurofibroma, pinealoma, retinoblastoma, sarcoma, seroma, trachomas, wilm's tumor and/or myeloma, multiple. The present sequence is an
                                                                                                                                             New antisense oligonucleotides inhibiting the synthesis of proteins involved in the formation of metastases such as transforming growth factor-beta 1 (TGF-beta 1), TGF-beta 2 and TGF-beta 3, useful for
           Stauder G;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Transforming growth factor beta; TGF-beta-3; antisense therapy; antisense oligonucleotide; ss; cancer; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Similarity 87.5%; Score 12.8; DB 14; Length 18; Similarity 87.5%; Pred. No. 2.2e+04; Pred. No. 2.2e+04; Conservative 0; Mismatches 2; Indels (
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense oligonucleotide targeting human TGF-beta-3 #304.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAP85456-60 represent polynucleotide sequences from the unique region of exon 1 of a rabbit motilin receptor gene. The specification describes an unique sequence present in exon 1 of the motilin receptor, which is not present in human or Sphaeroides nephelus 7587 motilin receptor sequences. The unique nucleic acid sequence is useful for measuring the ability of a compound to affect motilin receptor activity. Motilin receptor polynucleotides and polypeptides are useful for treating compounds which are useful for treating gastrointestinal diseases and disorders such as gastric motility disorders, gastroparesis, irritable bowel syndrome, and diarrhoea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel polypeptides related to dog and rabbit motilin receptor polypeptide, comprising unique regions from dog and motilin receptor amino acid sequence, useful for identifying compounds for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Gaps

Antisense oligonucleotide targeting human TGF-beta-3 #164.

17-NOV-2005 (first entry)

AEC51766;

ø

```
The invention relates to an antisense oligonucleotide or its active derivative selected from AEC46374-AEC46395, targeting human interleukin-
10 (IL-10). Also included are a process of manufacturing the antisense oligonucleotide (or its active derivative, by adding consecutive coligonucleotide chain), a pharmaceutical composition comprising the antisense oligonucleotide chain), a pharmaceutical composition comprising composition for treating cancer. The oligonucleotide is an antisense composition for treating cancer. The oligonucleotide is an antisense coligonucleotide inhibiting the synthesis of proteins involved in the formation of metastases. The oligonucleotide is an antisense coligonucleotide inhibiting the production of transforming growth factor (TGF)-beta 1, TGF-beta 2, TGF-beta 3, cell-cell adhesion molecules (CAMS), integrins, selectins, metalloproteases (MMPB), their tissue cinhibitors (TIMPB) and/or interleukins 10. The oligonucleotides are cinhibitors (TIMPB) and/or interleukins 10. The oligonucleotides are useful for the preparation of a pharmaceutical composition for inhibiting cancer, eg. bile duct carcinoma, bladder carcinoma, cuseful for treating cancer, bronchogenic carcinoma, carcinoma of the brain tumor, breast cancer, bronchogenic carcinoma, carcinoma, cervical cancer, ceptibelial carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, lugarented carcinoma, carcinoma, lugarented cancer, espithelial carcinoma, esphageal cancer, gall bladder carcinoma, lugarented cancer, hepatocellular cancer, cancer, head and neck cancer, hepatocellular cancer, luker, herman carcinoma, medullary carcinoma, non-small cell cancer, head and neck cancer, hepatocellular cancer, and carcinoma, medullary carcinoma, non-small cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  bronchogenic/lung carcinoma, ovarian cancer, pancreas carcinoma, papillary carcinoma, papillary adenocarcinoma, prostate cancer, small intestine carcinoma, rectal cancer, renal cell carcinoma, sebaceous gland carcinoma, sub ancer, squamous cell carcinoma, testicular carcinoma, uterine cancer, acoustic neuromas, neurofibromas, trachomas, and pyogenic granulomas; pre-malignant tumors, blastoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               hemangioblastoma, medullablastoma, melanoma, mesothelioma, neuroblastoma, deurofibroma, pinaloma, retinoblastoma, asrcoma, seminoma, trachomas, Wilm's tumor and/or myeloma, multiple. The present sequence is an antisense oligonucleotide targeting human TGF-beta-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotides inhibiting the synthesis of proteins involved in the formation of metastases such as transforming growth factor-beta 1 (TGF-beta 1), TGF-beta 2 and TGF-beta 3, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Stauder G;

```
The invention relates to an antisense oligonuclectide or its active derivative selected from AEC46395, targeting human interleukin-
CC derivative selected from AEC46394-AEC46395, targeting human interleukin-
CC 10 (IL-10). Also included are a process of manufacturing the antisense oligonuclectide chain), a pharmaceutical composition comprising the nucleosides and linker stepwise or by cutting the oligonuclectide chain), a pharmaceutical composition comprising the antisense oligonuclectide chain), a pharmaceutical composition comprising the antisense oligonuclectide inhibiting the synthesis of proteins involved in the formation of metastases. The oligonuclectide is an antisense oligonuclectide inhibiting the production of transforming growth factor (TGP)-beta 1, TGP-beta 2, TGP-beta 3, cell-cell adhesion molecules oligonuclectide inhibiting the production of transforming growth factor (TGMS), integrins, selectins, metalloproteases (WMPS) their tissue inhibitors (TIMPS) and/or interleukins 10. The oligonuclectides are useful for the preparation of a pharmaceutical composition for inhibiting the formation of metastases in cancer treatment. The oligonuclectides are useful for treating cancer, bronchogenic carcinoma, carcinoma, carcinoma, colon carcinoma, colon carcinoma, colon carcinoma, colon carcinoma, colorectal carcinoma, employmential cancer, epithelial carcinoma, employmential cancer, epithelial carcinoma, espancers gastric cancer, papithelial carcinoma, colon carcinoma, olon carcinoma, olon carcinoma, olon carcinoma, olon carcinoma, olon carcinoma, olon carcinoma, colorectal carcinoma, employment, prostate cancer, sapillary adenocarcinoma, papillary adenocarcinoma, prostate cancer, sapillary carcinoma, papillary adenocarcinoma, prostate cancer, sapillary carcinoma, rectal cancer, renal calcinoma, papillary adenocarcinoma, papillary adenocarcinoma, papillary accomen, sepancer, sequence, renal cancer, sequence, carcinoma, attentine cancinoma, uterine cancer, sequence cancer, sequence cancer, sequence cancer, s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    hemangioblastoma, medullablastoma, melanoma, mesothelioma, neuroblastoma,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       murine prostate cancer predisposing genes HPC2 and Mm.HPC2. The human version of the gene is found on chromosome 17p. Some alleles cause a predisposition to cancer, particularly prostate cancer. This gene and its protein can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic tools (both for cancer sufferers and those with a predisposition to the disease) and in the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                    Human prostate cancer (HPC)2 nucleic acids, polypeptides, and antibodies, useful for treatment and diagnosis of prostate cancer.

The invention relates to a human prostate cancer predisposing gene coding for an HPC2 polypeptide. The DNA and protein sequences are useful as diagnostic resquents for identifying a mutant HPC2 nucleotide sequence in a suspected mutant HPC2 allele by comparing the sequence of the suspected mutant HPC2 allele with a wild-type HPC2 sequence. The sequences are also useful for detecting an alteration in HPC2, where the alteration is associated with cancer in a human. The method involves analysing an HPC2 gene or an HPC2 gene expression product from a tissue of the human. The HPC2 gene is useful as a marker for prostate cancer and can be used in gene therapy techniques to suppress neoplastic growth of recipient cells which carry the mutant HPC2 allele. The sequences represent primers used in the methods of the invention, cDNA encoding human and mouse HPC2 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mouse; SRY; primer; PCR; polymerase chain reaction; amplification; probe; HMG box; human; bovine; sex; animal; birth; ss.

(KACH-) KACHIKU JUSEIRAN ISHOKU GIKUTSU KENKYUKU,

WPI; 1996-336575/34.

Bovine and mouse Sry-related DNA - useful for detecting e.g. the sex of unborn animals.

Example 2; Page 6; 21pp; Japanese.

The primers AAT33009-10 were used to amplify a fragment of the gene encoding a mouse SRY-related protein (AAT33007). This primer corresp. to bases 7156-7175 of the mouse gene. The amplified fragment was used to screen a mouse genomic library. The screen isolated 4 EcoRI fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene. Sequence analysis revealed a human SRY HMG box sequence between bases 7154-7393. Similarity with the human SRY HMG box sequence for use as a probe to isolate the bovine SRY-related gene (AAT33008). The mouse and bovine genes are useful for determining the sex of an animal prior to birth

Sequence 20 BP; 4 A; 6 C; 4 G; 6 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                       Description

/lab host="E. Coli strain XL10-Gold, T1-resistant, F-"
/clone lib="Mouse 10kb plasmid UUGCIM library"
/note="Twector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/G/ (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was blut-ida.cog/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymuclectide kinase. Adaptor oligonuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
chemically-competent E. coli X110-Gold (Stratagene) cells
and selected for ampicillin resistance."

Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREUS27/4 GUTAt 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
innert libraries for whole genome shotgun sequencing projects. In
Barrell, Oxford University Press, 1999).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Email: nelsayed@tigr.org

/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The
Nationalization of the constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated molectides were
ligated to the blunt ends in high molar excess. The
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose grin a derivative
of pWD42 (gi|4732114|gb|AF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pw042 (gil432114|gb|AR129072.1) a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AZ775974 2000 20 bp DNA linear GSS 16-FEB-2001 2M0009H14F Mouse 10kb plasmid UUGCIM library Mus musculus genomic clone UUGC2M0009H14 F, genomic survey sequence.

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinae. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWAD42 (gilfa732114 gpl)AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent R. coli Xil0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                υυαιναίε

/notes="Vector: PWD42Irr; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonicleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AP129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed inco

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gij 473214 gip Jh22072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

FEATURES

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwapto (gill #1732114 |gbl. #1732072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AU008116 Schizosaccharomyces pombe late log phase cDNA Schizosaccharomyces pombe late spc02889, mRNA sequence.

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of publy (1914) 4312114 [pgl AR129072.1], a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

/mote="Westor: PWD4Zny; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.05 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligomocleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114]gb|APL29072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Eutheria; Eutheria; Eutheria; Eurhorioglires; Glires; Rodentia; Sciurognathi; Muroidea; Murinae; Mus.

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWAD42 (gil-#1732114 |gb] AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

Sequence 5333, Application US/09198452A

Patent No. 6559294

GENERAL INFORMATION:

GENERAL INFORMATION:

TITLE OF INVENTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragment:

TITLE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, prevrature OF INVENTION: and treatment of infection

FILE REFERENCE: 9710-003-999

CURRENT APPLICATION NUMBER: US/09/198,452A

CURRENT PILING DATE: 1998-11-24

NUMBER OF SEQ ID NOS: 6849

LENGTH: 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              APPLICANT: Prizer Products, Inc.

GENERAL INFORMATION:

APPLICANT: Tartiqian, Sean V.

APPLICANT: Tartiqian, Jacques

APPLICANT: Simard, Jacques

APPLICANT: Simard, Jacques

APPLICANT: Myriad Genetics, Inc.

TITLE OF INVENTION: Chromosome 17p-Linked Prostate Cancer Susceptibility

TITLE OF INVENTION: Gene and a Paralog and Orthologous Genes

FILE REFERENCE: 2318-258

CURRENT APPLICATION NUMBER: US 60/107,468

FRIOR APPLICATION NUMBER: US 60/107,468

FRIOR APPLICATION NUMBER: 1998-11-05

FRIOR PRING DATE: 1998-11-05

NUMBER OF SEQ ID NOS: 240

SEQ ID NO 157

LENGTH: 19

FREMINGRAL INFORMATION:

APPLICANT: Tasarev, Sergei. A., Emerson,

APPLICANT: Suzanne U., Purcell, Robert H.

TITLE OF INVENTION: Recombinant Proteins Of

TITLE OF INVENTION: A Pakistani Strain Of Hepatitis E And Their

TITLE OF INVENTION: Use In Diagnostic Methods And Vaccines

NUMBER OF SEQUENCES: 107

CORRESPONDENCE ADDRESS:

ADDRESSEE: MARGAN & FINNEGAN

STREET: 345 PARK AVENUE

STATE: NEW YORK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       COUNTRY: USA

Batent No. 6207416

GENERAL INFORMATION:
APPLICANT: Tearev, Sergei. A., Emerson,
TITLE OF INVENTION: Recombinant Proceins Of,
TITLE OF INVENTION: A Parkistani Strain Of Hepatitis E And Their
TITLE OF INVENTION: A Parkistani Strain Of Hepatitis E And Their
TITLE OF INVENTION: Use In Diagnostic Methods And Vaccines
NUMBER OF SEQUENCES: 107
CORRESPONDENCE ADDRESS:
ADDRESSEE: MORGAN & FINNEGAN, L.L.P.
STREET: ASS PARK AVENUE
CITY: NEW YORK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Sequence 4779, Application US/09422978

Patent No. 653751

GENERAL INFORMATION:

APPLICANT: Cohen, Daniel

APPLICANT: Chumakov, Ilva

TITLE OF INVENTION: Biallelic markers for use in constructing a high density...

PILE REFERENCE: GENERAL 099-10-20

CURRENT APPLICATION NUMBER: US/09/422, 978

CURRENT PILING DATE: 1999-04-21

EARLIER PILING DATE: 1999-04-21

EARLIER FILING DATE: 1998-04-21

EARLIER FILING DATE: 1998-04-21

MUMBER OF SEQ ID NOS: 11796

SEQ ID NO 4779

LENGTH: 18
